

TECHNICAL SOFTWARE AUDIT

Your system works. But do you know what it's hiding?

Most systems “work in practice” — and that's exactly where security flaws, data leaks and silent errors hide, the kind that only surface at the worst possible moment: with a customer, in production, too late.

What we do: we build **our own tools and processes inside Claude Code (AI)** to scan already-built systems and find real improvements — in security, logic, database and infrastructure. And we prove the value before you pay: we hand you a **free sample** that runs in your own environment.

Why an independent audit

Whoever builds a system sees what it does — not what it hides. An outside eye, armed with a rulebook built from **real production incidents**, finds what went unnoticed for months:

Security

Passwords and keys exposed in the code, SQL injection, versioned ``.env``, weak authentication, data leaking between customers.

Logic & data

Errors swallowed in silence, status that “lies” to the customer, database writes that fail without warning, dead code.

Infrastructure

Containers with no resource limits or healthcheck, data loss on recreation, secrets sitting in configuration files.

Compliance

Exposure of personal data, no audit trail — concrete GDPR/LGPD risks.

Already building with AI (Claude and the like)? Even better — and one more reason to audit.

AI speeds up the build, but it doesn't replace an independent review. Even a system built with Claude's help has routines, logic and integrations that still **can — and should — be improved and protected**. It's the second, specialized pair of eyes that separates “it works” from “it's secure”.

Our method

- ▶ **A battle-tested rulebook, not a generic checklist.** Every rule we apply was born from a real bug that cost hours or customers. Over 15 years of production systems, distilled into audit processes.
- ▶ **Evidence, not guesswork.** Every issue we report comes with file, line and the code snippet. No false alarms.
- ▶ **Business language.** You get the risk explained as impact — not as technical jargon.

Free · no strings attached

The Sample — see it working on YOUR system

A kit **you run yourself, in your own environment**. In minutes, it runs a high-impact scan and shows the most severe critical problems — stopping at the first ones so you feel the value.

- 1 You copy your project into an isolated folder (the original is never touched).
 - 2 You run the kit in Claude Code, on your own machine.
 - 3 You get a local report with the risks found and a score for your system.
- ✓ **You stay in control of your data.** The report stays local, on your machine. **We, the consultants, do not receive your code or the result**, and nothing is published.

Transparency: since Claude is an Anthropic service, the files it reads are processed on Anthropic's servers, under the data policy of the account you use — as with any use of Claude. If privacy is critical, use an account/mode without training retention. What we guarantee is that the kit sends nothing to the consultants and does not expose the result.

From the sample to the full audit

Sample

Quick diagnosis

Free. Shows whether there are hidden critical risks. Runs in your environment.

Security

Information Security Audit

Full focus on vulnerabilities, secrets, authentication and GDPR/LGPD risks.

Logic

Application Logic Audit

End-to-end flows, silent errors, data integrity and robustness.

Complete

360° Audit

Security + logic + database + infrastructure, with **double verification** of every finding and a prioritized remediation plan.

Start with the free sample

Find out in minutes what your system is hiding — at no cost and without sending your code to anyone.
